Preface	vii
Glossary	xiii
1. Maxwell's Equations	1
1.1 Review of familiar basics	1
1.2 Continuity equation; conservation of charge	2
1.3 Potentials, gauge invariance; radiation gauge, Lorentz gauge	3
1.4 Force, work, energy conservation	6
1.5 Conservation of momentum	8
1.6 Conservation of angular momentum	11
1.7 Virial theorem	12
2. Electromagnetic Pulses	15
2.1 Conserved energy, momentum, angular momentum	15
2.2 Energy velocity, momentum velocity	16
2.3 Unidirectional pulses	20
3. Lorentz Transformation	23
3.1 Coordinate transformation, 4-vector, 4-dyadic	23
3.2 Infinitesimal transformations; rapidity	25
3.3 Transformation laws for fields	27
3.4 4-columns, 4-rows	32
3.5 Finite Lorentz transformations	41
3.6 A digression: Dirac's magnetic monopole	45

4.	3+1-Dimensional Notation	49
4.1	Contravariant and covariant components	49
4.2	Field dyadic; energy-momentum dyadic	52
4.3	Wave 4-vector; 4-velocity; Doppler effect	56
5.	Action, Reaction — Interaction	61
5.1	Action principles of classical mechanics	61
5.1.1	Lagrange's formulation	61
5.1.2	Hamilton's formulation	63
5.1.3	Schwinger's formulation	64
5.1.4	Velocity-dependent forces	65
5.2	Lagrange function of the electromagnetic field	68
5.3	Particles and fields in interaction	71
5.4	Disposing of the gauge-dependent terms	71
6.	Retarded Potentials	75
6.1	Green's function	75
6.2	Liénard–Wiechert potentials	80
6.3	Retarded time	80
7.	Radiation Fields	85
7.1	Far fields	85
7.2	Emitted power	89
7.3	Larmor formula	92
7.4	Longitudinal and transverse components of a field	95
7.5	Charge point of view	98
7.6	Simple model antenna	102
8.	Spectral Properties of Radiation	107
8.1	Fourier-transformed fields	107
8.2	Spectral distribution	110
8.3	Dipole approximation	112
8.4	Impulsive scattering	114
8.5	Bremsstrahlung	117
9.	Time-Dependent Spectral Distribution	119
9.1	Time-dependent power spectrum	119
9.2	Constant acceleration	120
9.3	Cherenkov radiation	124

10. Synchrotron Radiation	129
10.1 Kinematics	129
10.2 Time-dependent spectrum	131
10.3 Total radiated power	133
10.4 Power emitted into the m th harmonic	138
10.5 High harmonics	144
10.6 “Roll over”	146
10.7 Polarization	148
10.8 Angular distribution	153
10.9 Qualitative picture	155
11. Scattering	157
11.1 Thomson scattering	157
11.2 Rayleigh scattering	159
12. Diffraction	165
12.1 Encounter with Huygens’s principle	165
12.2 Large apertures	169
12.3 Single large circular aperture	170
12.3.1 Differential cross section	170
12.3.2 Total cross section	171
12.3.3 Small diffraction angles	173
12.4 Induced surface currents	175
12.5 Large obstacles	176
12.6 Poisson’s spot	178
12.6.1 Bright center in the shadow	178
12.6.2 Size of the bright center	180
12.6.3 Central intensity behind a long strip	183
12.7 Diffraction at a straight edge	185
12.7.1 Transition region	186
12.7.2 Exact solution	188
Exercises with Hints	197
Exercises for Chapters 1–12	197
Hints	217
Electromagnetic Units	227
Index	231
