

NATIONAL UNIVERSITY OF SINGAPORE

PC4245 PARTICLE PHYSICS

(Semester II: AY 2008-09)

Time Allowed: 2 Hours

INSTRUCTIONS TO CANDIDATES

1. This examination paper contains **FOUR (4)** questions and comprises **SIX (6)** printed pages.
2. Answer **ANY THREE (3)** questions.
3. Answers to the questions are to be written in the answer books.
4. This is a **CLOSED BOOK** examination.
5. **One Help Sheet (A4 size, both sides) is allowed** for this examination.
6. The Clebsch-Gordan coefficient table is attached on the last printed page.
7. A Table of Constants will be supplied.

1. (a) Show that the invariant mass of a pair of photons of energies E_1 and E_2 with angle θ between their directions of motion is given by the expression

$$M^2 = \frac{4E_1 E_2}{c^4} \sin^2\left(\frac{\theta}{2}\right)$$

- (b) Consider the decay of a particle of mass m and energy E into two photons, and show that the minimum opening angle between the photons is given by:

$$\sin\left(\frac{\theta_{min}}{2}\right) = \frac{mc^2}{E}$$

A particle of energy 10 GeV decays to two photons with an opening angle of 2° . Could this particle be an η meson (of mass 549 MeV) or a π^0 meson (of mass 135 MeV)?

- (c) Consider the decay $A^0 \rightarrow \gamma + \gamma$.

Given that the amplitude for the process is $M(\vec{p}_2, \vec{p}_3)$, where \vec{p}_2 and \vec{p}_3 are respectively the 3-momenta of the two outgoing photons,

- (i) find the decay rate in terms of m_{A^0} and $M(\vec{p}_2, \vec{p}_3)$, where m_{A^0} is the mass of A^0 .
- (ii) What are the values of $|\vec{p}_2|$ and $|\vec{p}_3|$?

Note : The following formula for the decay process $1 \rightarrow 2 + 3$ can be used:

$$d\Gamma = \frac{S}{2\hbar m_1} |M|^2 \frac{d^3 \vec{p}_2}{(2\pi)^3 2p_2^0} \frac{d^3 \vec{p}_3}{(2\pi)^3 2p_3^0} (2\pi)^4 \delta^{(4)}(p_1 - p_2 - p_3)$$

- (d) Consider the annihilation of positronium (e^+e^-) into gamma photons from the S-state ($L=0$). Using arguments from charge conjugation invariance and energy-momentum conservation, explain why para-positronium (where e^+ and e^- have opposite spins) is likely to decay to two photons while ortho-positronium (where e^+ and e^- have parallel spins) is likely to decay to three photons.

2. (a) The Dirac Hamiltonian is given by:

$$H = c [\vec{\alpha} \cdot \vec{p} + \beta mc]$$

Using this Hamiltonian, construct the normalized spinors $u^{(+)} \text{ and } u^{(-)}$ representing an electron of momentum \vec{p} with helicity ± 1 . That is, find the u 's that satisfy the Dirac Hamiltonian equation with positive energy E , and are at the same time eigenspinors of the helicity operator $\frac{\vec{\Sigma} \cdot \vec{p}}{|\vec{p}|}$ with eigenvalues ± 1 .

Hints:

- Use the following normalization condition:

$$u^\dagger u = 2E/c$$

- $\vec{\Sigma} = \begin{pmatrix} \vec{\sigma} & 0 \\ 0 & \vec{\sigma} \end{pmatrix}, \quad \vec{\alpha} = \begin{pmatrix} 0 & \vec{\sigma} \\ \vec{\sigma} & 0 \end{pmatrix}, \quad \beta = \begin{pmatrix} I & 0 \\ 0 & -I \end{pmatrix}$

$$\sigma^1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \sigma^2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \sigma^3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}.$$

(b) (i) Simplify the following expression:

$$\gamma^\mu \gamma^\nu (1 - \gamma^5) \gamma^\lambda (1 + \gamma^5) \gamma_\lambda$$

(ii) Prove that the trace of the product of an odd number of gamma matrices is zero.

(iii) Prove the following trace theorem:

$$\gamma_\mu \gamma^\nu \gamma^\lambda \gamma^\sigma \gamma^\mu = -2 \gamma^\sigma \gamma^\lambda \gamma^\nu$$

Hint - The following formulae may be used without proof:

$$\{\gamma^\mu, \gamma^\nu\} = 2g^{\mu\nu} \quad ; \quad \{\gamma^5, \gamma^\mu\} = 0$$

3. (a) Members of the baryon decuplet typically decay after 10^{-23} seconds into a lighter baryon (from the baryon octet) and a meson (from the pseudoscalar meson octet).

Using isospin arguments, deduce all the possible strong decay modes for

$$(i) \Delta^{++} \quad (ii) \Delta^-$$

Hints:

- Members of the baryon octet form the following isospin multiplets:

$$\begin{pmatrix} p \\ n \end{pmatrix}, \begin{pmatrix} \Sigma^+ \\ \Sigma^0 \\ \Sigma^- \end{pmatrix}, \begin{pmatrix} \Xi^0 \\ \Xi^- \end{pmatrix}, \Lambda$$

- Members of the pseudoscalar meson octet form the following isospin multiplets:

$$\begin{pmatrix} K^+ \\ K^0 \\ K^- \end{pmatrix}, \begin{pmatrix} \pi^+ \\ \pi^0 \\ \pi^- \end{pmatrix}, \begin{pmatrix} \bar{K}^0 \\ K^- \end{pmatrix}, \eta$$

- (b) Deduce the ratio of the decay modes of the f meson ($I=0$) :

$$\frac{f \rightarrow \pi^0 \pi^0}{f \rightarrow \pi^+ \pi^-}.$$

(Note: the Clebsch-Gordan coefficient table is attached.)

- (c) Discuss two pieces of experimental evidence for the existence of colour in QCD.

- (d) Is the neutrino an eigenstate of P? If so, what is its intrinsic parity?

- (e) Draw the Feynman diagrams for the following weak decays:

$$(i) \quad \Lambda(\text{uds}) \rightarrow p^+ + e^- + \bar{\nu}_e$$

$$(ii) \quad n \rightarrow p^+ + e^- + \bar{\nu}_e$$

Use Cabibbo theory to comment on their relative decay rates.

4. (a) Draw the lowest-order Feynman diagrams for Compton scattering:

$$e^- + \gamma \rightarrow \gamma + e^-$$

(b) Using the Feynman rules for quantum electrodynamics, obtain the scattering amplitude $M = M_1 + M_2$ for the above process.

(c) Prove that the spin-averaged amplitude $\langle |M_1|^2 \rangle$ for Compton scattering, averaged over both electron and photon spins, is given by:

$$\langle |M_1|^2 \rangle = \left[\frac{g_e^2 / 2}{(p_1 - p_3)^2 - m^2 c^2} \right]^2 Q_{\mu\lambda} Q_{\kappa\nu} \\ \times \text{Tr} [\gamma^\mu (p_1 - p_3 + mc) \gamma^\nu (p_1 + mc) \gamma^\kappa (p_1 - p_3 + mc) \gamma^\lambda (p_4 + mc)]$$

where $Q_{\mu\nu} \equiv \begin{cases} 0 & \text{if } \mu \text{ or } \nu \text{ is 0} \\ \delta_{ij} - \hat{p}_i \hat{p}_j & \text{otherwise} \end{cases}$

(d) Derive the corresponding expression for the spin-averaged $\langle M_1 M_2^* \rangle$.

(e) Draw all 17 fourth-order (four-vertex) Feynman diagrams for Compton scattering.

Note - The following formulae can be used without proof:

- $\sum_s u^{(s)}(p) \bar{u}^{(s)}(p) = p + mc$
- $\sum_s v^{(s)}(p) \bar{v}^{(s)}(p) = p - mc$
- $\gamma^0 \gamma^{\mu+} \gamma^0 = \gamma^\mu$
- $\sum_s \epsilon_\mu^{(s)} \epsilon_\nu^{*(s)} = Q_{\mu\nu}$

(TKB)

- END OF PAPER -

32. CLEBSCH-GORDAN COEFFICIENTS, SPHERICAL HARMONICS, AND d FUNCTIONS

Note: A square-root sign is to be understood over every coefficient, e.g., for $-8/15$ read $-\sqrt{8/15}$.
